

CHATTING

APPLICATION

WIREFRAME DOCUMENT

Creating a wireframe for a chat application using Java involves sketching out the basic layout and structure of the user interface (UI) to visualize how different components will be arranged. Below is a simplified textual representation of a wireframe for a chat application. Please note that wireframes are typically created using dedicated wireframing or UI design tools for a more visual and precise representation.

- **User Profile:** Displays user information and profile picture.
- **Chat List:** Lists active chats with unread message counts. Clicking on a chat opens the chat window.
- **Chat Window:** Displays the chat conversation with a specific user or group.
- **Message Input:** Allows the user to type and send messages.
- **Send Button:** Clicking this button sends the typed message.
- **Online Users:** Lists online users available for one-on-one chats.
- **Group Chats:** Lists available group chats.
- **Create Group:** Button to create a new group chat.
